

Anti Slip

Safety Treatment for Hard Floor Surfaces

Anti Slip is a fluoride based liquid chemical safety treatment, which provides increased slip resistance when applied to tiled, granite, terrazzo and concrete floors.

Features and Benefits

Appearance

Produces little or no change in colour even when applied to glazed or polished surfaces. The level of shine may be reduced on highly polished tiles to achieve an anti slip surface.

Long Life

Anti Slip is not a surface coating but rather, a penetrant, and lasts for the entire life of the surface.

Application

Carried out by trained applicators, floors can be treated in a matter of hours. Upon completion, the floor is washed and dried and is immediately available for use.

Hygienic

Ideal for use in sterile and food preparation areas, including hospitals, restaurants and laboratories. (Independent test results by registered microbiologists show that tiles treated with Anti Slip do not harbour bacteria or provide any increased disinfecting requirements than untreated tiles. Test results are available).

Maintenance

Good regular cleaning is all that is required to maintain the slip resistant qualities. Anti Slip DM safety cleaner is a quality cleaning material that will greatly assist in the maintenance of safe floors under all conditions.

Performance

Government tests show an average 69% improvement in Anti Slip treated tiles tested under "wet" conditions. Test results are available.

Recommended Use

All grades of ceramic and quarry tiles, un-sealed terrazzo, steel trowelled concrete and a wide range of polished stone floors. Particularly relevant to "set" areas such as pool surrounds, kitchens, laundries, bathrooms, showers, and any external floors, or foyers.
